

What if legal systems recognized river time?

Previously...

... governments maintained an official time standard by counting the pulsations of cesium atoms in laboratories, and mandated standard time by law. Government-issued time signals were unquestioningly followed by industry and individuals.

In the future...

... the velocity of rivers could carry local temporal authority. Municipal clocks would reflect regional environmental conditions, and would condition how people interacted with their environment. Humans would be prompted to integrate themselves into local ecosystems. Freed from legal meddling, nature would have the right to live at its own pace.
